

## About

The material of the cone is unrivaled by the sound itself. Gone are the drawbacks of fullranges! Simply beautiful fluidity from a single point source extending from 32 Hz to 20 kHz!

## Our Background

Because they are 100 dB sensitive, they deliver high SPL with small amounts of power, which means that the cone doesn't move as it would if you had to use a higher-powered amplifier to drive it. That means there is no Doppler distortion in the mid-range, shying away from those requiring a power-hungry monster with multiple drivers and an elaborate crossover that drains power unnecessarily..

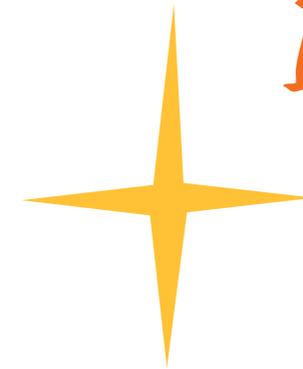

These are great vented cabinets designed by the same genius who creates the controllers. This means that he understands that there can be no return wave reflections within the cabinet with such a thin cone material. Instead of filling the box with fiberglass that only kills the dynamics, he designed the shape to reflect everything in the exact center of the box where the waves become scalar, that is, they cancel each other out. It's a very zen way of doing things.

Lii Audio

Audio Review

Crystal  
10

The bass response from these speakers will literally put your subwoofer down, no matter what brand, type or amount of power it uses. When you listen to 32Hz with the speed of this controller and the PERFECT harmonics with the rest of the music, since it ALL comes from a single voice coil, you're just going to shake your head in disbelief.

Playing music with low bass on these speakers will shake your whole house without sounding compressed or forced and without even having to turn up the volume, and best of all, do it easily with just a 2-watt amplifier.

There is no other full-range speaker that goes from 32 Hz to 20 kHz with a sensitivity of 100 dB.

The talent of the genius at Lii Audio is able to bring you this speaker that is sure to be legendary.
